13. ABSTRACT (Maximum 200) Significant numbers of breast cancer patients will experience a recurrence of their disease. Breast cancer recurrence is a time of enormous crisis, with significant distress, depression, and symptomatology, and few effective coping strategies. Targeted support services are currently unavailable. This study tests the hypothesis that patients experience greater well-being by participating in an intervention designed for breast cancer patients experiencing a first recurrence. Following a pilot study phase, 300 breast cancer patients will be enrolled within 8 weeks post-recurrence. All participants are Southwest Oncology Group (SWOG) institutions. The women will be randomly assigned to a control group or an intervention to be carried out by Y-Me, a national breast cancer support and advocacy organization. The intervention consists of 4 to 8 structured sessions providing information and peer support delivered by breast cancer survivors via telephone. Endpoints are assessed at baseline and 3 and 6 months later through validated quality of life and depression questionnaires. This study provides information about improving well-being during a little-studied portion of the breast cancer trajectory. The intervention is delivered by individuals who are well-qualified to provide support: women who themselves have experienced breast cancer recurrence. The project utilizes a cost-effective approach with the potential for widescale dissemination.

**SOUTHWEST ONCOLOGY GROUP  
DAMD17-96-1-6009 ANNUAL REPORT**

**Enhancing Well-Being During Breast Cancer Recurrence**

**INTRODUCTION**

**A. Subject and Purpose of the Research**

This project uses a two phase implementation process to determine whether patients will experience greater levels of well-being as a function of participating in an intervention designed for breast cancer patients experiencing a first recurrence.

A Pilot Study will be conducted in selected Southwest Oncology Group institutions to: refine intervention protocol materials; develop operating procedures to ensure coordination and communication between the Principal Investigator, Southwest Oncology Group Operations Office, the Study Coordinator, the Southwest Oncology Group Statistical Center, Y-ME, and the institutions accruing patients; develop a training program for the breast cancer survivors who will provide the intervention; finalize assessment questionnaires and examine length and ease of administration by telephone, especially with respect to burden for institution staff; and examine participation and attrition.

The Main Study will be open to all Southwest Oncology Group institutions. A randomized, two group design will be used to evaluate the impact of a telephone intervention delivered by breast cancer survivors on well-being in patients experiencing a first recurrence of breast cancer versus written information. The primary objective of the main study is: to assess the effectiveness of a telephone intervention delivered by breast cancer survivors on well-being in patients experiencing a first recurrence of breast cancer versus written information delivered by mail.

The secondary research objectives of the full trial are: to examine the impact of sociodemographic, clinical, and psychosocial predictors of well-being in patients experiencing a first recurrence of breast cancer; and to examine changes in well-being over time since recurrence.

**B. Background of Previous Work**

The Psychosocial Impact of Breast Cancer Recurrence

Despite significant increases in five-year breast cancer survival rates, mortality curves for these patients have remained largely unchanged for many years. While many breast cancer patients, especially women diagnosed with Stage I disease, can realistically expect to be cured of their disease, significant numbers of patients will experience a recurrence of their breast cancer at some point following diagnosis, treatment, or a disease-free period. Although this statistic is not generally emphasized, when all stages of breast cancer are considered, as many as 50% of patients will experience recurrence.

Recurrence marks a significant change in the breast cancer care continuum, since it brings home the limits of current knowledge in oncology. The cancer care team must acknowledge that the treatment did not work: that all of the optimism, faith in medicine, and careful compliance with treatment were not enough to forestall disease progression. The patient and family may question whether all of the suffering that they have gone through was really worth it, and they may have a sense of failure: not only about treatment, but about themselves. They must deal with a new reality: that the patient is experiencing pain and other symptoms of her recurrence, that chances for cure have been reduced, and that once again, treatment decisions need to be made.

What is a woman's experience when the worst happens – that is, when breast cancer returns? Surprisingly, very little attention has been given to this issue in the literature: only nine studies have been reported about recurrence of any cancer during the past 15 years (1). We do know that the patients identify the threat of recurrence as one of the most feared possible outcomes of cancer. The fear of recurrence repeatedly emerges as an important psychosocial theme in breast cancer patients who are newly-diagnosed (2, 3), attending follow-up visits (4), and among long-term survivors (5).

The largest study based on data from patients actually experiencing a recurrence is Worden's cross-sectional study of 102 individuals with recurrences of various cancers (6, 7). Worden found that distress levels of the patients with recurrence were high and equivalent to levels in newly-diagnosed patients. Compared to newly-diagnosed patients, the individuals in this study were less willing to participate in interventions focused solely on psychosocial counseling and more concerned about their medical problems and existential concerns. Among the factors that predicted higher distress were more symptoms, lack of social support, less hope, and being younger. Cella, Mahon, and colleagues (8, 9) also assessed adjustment in 40 patients within one month of recurrence; the patients represented a variety of cancer sites, and 27 were experiencing a first recurrence. Patients in this study experienced high levels of distress: they "almost universally agree that recurrence is more upsetting than initial diagnosis" (8, p. 20). There was a suggestion that having anticipated the possibility of recurrence aided adjustment: patients who reported that they were "completely surprised" by the recurrence fared the worst.

Several studies have focused on breast cancer recurrence. Silberfarb et al. (10) compared psychosocial status in groups of breast cancer patients during initial diagnosis (N=50), first recurrence (N=52), and metastatic disease (N=44). The findings indicated that the stage of first recurrence clearly was the most emotionally stressful time in their samples (10, p. 454). Significantly, only one woman out of the 52 could identify a single coping strategy she had found helpful, in marked contrast to the other two groups. In addition, the findings of this study illustrate how recurrence is often marked by physical impairment as well: 81% of the women in the recurrence group reported pain, the highest percentage of any group. Jenkins et al. (11) evaluated 22 women with newly-diagnosed breast cancer recurrence, and found that 45% experienced depression and anxiety at the level of psychiatric diagnosis; previous psychiatric illness was a significant predictor of recurrence distress. A recent study by Lewis and Deal (1) further described problems in 15 married couples in which the wife was diagnosed with a recurrence of breast cancer. A number of problems in marital adjustment were reported, as well as depression experienced by 40% of the women; the recurrence had been diagnosed a median of 10 months previously, indicating the long-lasting psychosocial impact of breast cancer recurrence and the potential that intervention could provide a real benefit for these patients.

#### Interventions to Reduce Psychosocial Distress

No intervention directed at the needs of patients experiencing a recurrence of breast cancer (or any other cancer) has been reported. However, several reviews (12-14), including a recent meta-analysis (15), have concluded that psychosocial interventions have a positive impact on the well-being of patients across the spectrum of disease stages and sites. To date, research has not established whether one kind of intervention is more effective than another, or more appropriate for certain patients. A variety of intervention types (e.g., informational, psychological, behavioral, social support) and formats (e.g., group, individual, telephone) have demonstrated beneficial effects. Effects have been demonstrated for quality of life, symptom management, and psychological functioning. The optimal point to evaluate the impact of psychosocial interventions has not been firmly established; most studies assess outcomes at one or more intervals during the first year post-intervention (12-14), although impacts may be long-lasting, even extending to ultimate survival (e.g., 16).

This study draws on an approach which has been found effective by a number of investigators: a brief, time-limited intervention combining information and support delivered by telephone. The telephone is

frequently used in providing information regarding cancer treatment and counseling (17-22). In particular, the telephone may make services available to individuals for whom traveling would pose difficulties because of geography, health, or access to transportation. The telephone-directed intervention approach is especially well-suited to the Southwest Oncology Group setting, given the potential of providing standardized assessment across participating institutions at a relatively low cost. Other cooperative groups, including the Eastern Cooperative Oncology Group and the Cancer and Leukemia Group B, are currently conducting research protocols utilizing telephone-delivered interventions, although no other group has focused on patients with recurrence. In fact, patients with recurrence appear to have recourse to few specialized resources; although resource and support programs frequently offer assistance to newly diagnosed patients, hospice patients, and (increasingly) to survivors, patients going through a recurrence seem to "fall between the cracks."

### The Use of Lay Organizations to Provide Support to Breast Cancer Patients

The intervention will be provided by women who are particularly well-qualified to provide support and information: breast cancer survivors who have themselves experienced recurrence. A distinctive feature of this study is its delivery of the intervention through an established national breast cancer advocacy and support organization, Y-ME. Although Y-ME has provided telephone hotline services (using a toll-free 800 number) since 1987, the impact of the service has not been systematically assessed. This is also true for other lay programs for breast cancer patients, such as the American Cancer Society's Reach-to-Recovery program (23). This study will utilize breast cancer survivors within the context of a structured protocol, as well as standardized and validated outcome measures. If the program proves effective, it can become part of Y-ME's program and be delivered on a standard basis. The use of a voluntary organization staffed with non-health professionals represents a cost-effective approach to providing support. Y-ME has participated in a Southwest Oncology Group Lay Advisors/Advocates Steering Committee for the past two years. The lay advisors (who include representatives of national organizations and volunteers selected through a nationwide search) are special members of the Group, serve as members of Disease and other Committees (including the Committee on Women and Special Populations and the Breast Cancer Committee), and attend semi-annual Group meetings. The lay advisors contributed to the development and design of this protocol.

This study will provide information about how to improve well-being during a portion of the breast cancer trajectory where little attention has been focused. The project utilizes a cost-effective approach to intervention with demonstrated usefulness in cancer patients. The intervention will be delivered by individuals who are especially well-qualified to provide support: women who themselves have experienced breast cancer recurrence. This project represents one of the first formal research collaborations between a clinical cooperative research group and a lay breast cancer organization. The project reflects the overriding motivation of both groups: to provide the best possible care and support to cancer patients.

## **BODY**

### **A. Experimental Methods**

#### Overview

The Pilot Study involved 30 women meeting the eligibility criteria who all participated in the intervention and completed the outcome assessment questionnaires. The Main Study utilizes a two arm randomized design with repeated measures at three time points. Three hundred breast cancer patients commence participation following a first recurrence of breast cancer. At that time, the participants complete a battery of instruments, including baseline measures of well-being. Participants are stratified by age (< 50 years vs. ≥ 50 years), time since diagnosis (< 2 years vs. ≥ 2 years), and recurrence site (soft tissue/bone vs.

visceral) and randomly assigned to intervention group (intervention vs. control). Participants in the intervention group complete an intervention completed within a four-week period; the intervention will cover four discrete content areas and will be carried out in four to eight telephone calls. Assessments of well-being are collected at approximately three months post-baseline, and again 6 months post-baseline. The primary outcome is well-being, including quality of life (as measured by the Cancer Rehabilitation Evaluation System-Short Form (CARES-SF) [24-30]) and depression (as measured by the Center for Epidemiologic Studies-Depression scale (CES-D) [31-32]).

#### Eligibility Criteria

Eligibility criteria include: having received definitive surgical treatment for Stage I, II, or IIIa breast cancer and being diagnosed with a first recurrence of breast cancer in the past 42 days (pilot study) or 56 days (main study); being female; no current psychiatric diagnosis affecting ability to participate in the intervention; ability to read and understand English. In the first eight months the pilot study was open, patients must have had no previous enrollment or plans to enroll on a Southwest Oncology Group treatment protocol; this restriction was eliminated for the last portion of the pilot study and for the main study. All patients must complete baseline questionnaires to participate. Institutional Review Board approval must have been received prior to patient registration.

#### Procedures

*Pilot Study:* All women completed baseline questionnaires and received a questionnaire packet to complete and return by mail in six weeks. All women will be provided with a basic information packet including a copy of the Y-ME booklet "I Still Buy Green Bananas" and a list of agencies which provide cancer-related information. All participating institutions compiled materials about resources available in their catchment area. Project staff compiled information on national organizations such as Y-ME, the Cancer Information Service (1-800-4-CANCER), and the American Cancer Society as part of the information packet. All women in the pilot study received the four session telephone intervention from Y-ME peer counselors.

*Main Study:* All women complete the baseline questionnaires and are provided with basic information (as above). Women in the *control group* receive no additional intervention. They are mailed self-administered assessment questionnaires to complete 3 months and 6 months later. After completing the final assessment, they are given the same packet of materials provided earlier to the women in the intervention group. Patients in the *intervention group* are provided with an intervention consisting of four to eight counseling/information sessions delivered by Y-ME counselors by telephone over a one-month period.

A standardized intervention protocol is used, and calls should require no longer than 45 minutes to complete. Each call focuses on different problem areas from the group below. The modules reflect psychosocial, physical, and existential concerns. Each woman is given a choice about the order in which the sessions are presented. Each call provides basic information and the opportunity for the patients to discuss individual concerns. The general format is to provide information in specified areas, active listening when the women discuss their concerns, assistance in problem-solving, and information about resources that may be helpful.

The intervention is not designed to provide psychotherapy. Instead, the Y-ME peer counselors provide information, peer support, and referrals to community organizations. Procedures currently in place at Y-ME are used if serious psychological disturbance is detected during a telephone session. In such cases, patients are asked if the Y-ME peer counselor can contact the Southwest Oncology Group physician who enrolled her on the study. Following the first session, the patients are sent a packet of written materials.

## Study Endpoints

The primary endpoint in this study is well-being (CARES-SF psychosocial functioning and depression) three months post-enrollment in the study. A CARES-SF Psychosocial score of .615 or greater will designate impaired psychosocial functioning. This cut-off has been found to correctly classify breast cancer patients "at risk" for psychosocial distress, as identified in a comprehensive clinical interview by a social worker; the estimated probability of classifying women in the high risk group was .81 in a recursive partitioning model (30). Depression will be indicated by a score of 16 or above on the Center for Epidemiological Studies – Depression (CES-D) scale (31-32).

Longer-term well-being will also be examined at 6 months post-study entry. The intervention will also be evaluated through a standardized "Telephone Counseling Evaluation Form." A "Psychosocial Predictors Form" will be used to examine possible predictors of well-being. These include: social support (measured by Reynolds et al.'s four-item scale [33]); optimism-pessimism (measured using the total score on the Life Orientation Test (LOT) [34-35]); surprisingness of the recurrence (8); and, Sense of Coherence Scale (SOC) (36-38). A "Current Cancer Treatment" form will ascertain treatments being received at baseline, 3 and 6 months.

## Analysis

Anticipated total accrual for the Pilot Study was 30 patients. Sample size for the Main Study is 300 patients, with 255 patients expected to be available at the three-month assessment point. Power calculations indicate that a sample size of 255 is sufficient to test intervention vs. control group differences for the two primary endpoints (CARES-SF Psychosocial cutoff score and CES-D cut-off score); with a power of .90 and a one-tailed alpha-level of .025, the study will be able to detect differences in proportions of women who score "at risk" of 20% between the intervention and control groups. Secondary analyses will utilize logistic and least squares regression analyses.

## **B. Results/Progress to Date**

*Current Status.* The protocol for the study was activated by the Southwest Oncology Group on June 1, 1997. The target sample size of 30 patients was reached in July 1998. The Main Study opened Group-wide on July 15, 1998 for activation by all Southwest Oncology Group institutions. The first patient was accrued to the protocol in September 1998. As of June 4, 1999, 57 patients had been entered on the study. Accrual has steadily increased over the 1999 calendar year as more institutions activated the study. The accrual has been stable at approximately 10 per month for the past three months.

During the past year, the following activities have been completed:

1. Recruitment and training of additional peer counselors (Y-ME) (due to disease progression in two of the original counselors).
2. Development of continuing education and provision of feedback and reinforcement for Y-ME peer counselors by Dr. Taylor and Ms. Perotti. These activities were implemented based on suggestions from the counselors from the Pilot Study.
3. Revision of the protocol document. Five revisions to the protocol were made since the protocol was activated. All modifications were administrative corrections (e.g., change in telephone numbers for contact persons, correction of typographical errors) or clarifications of procedures.
4. Periodic mailings from Dr. Gotay to the Project Team and Principal Investigators and Data Managers at participating institutions to encourage their participation, provide sample materials, and communicate new information. Two mailings were made during this project year. Dr. Gotay

will continue such communications to all institutions which activate the Main Study throughout the period of accrual.

5. As Study Coordinator, Dr. Gotay continues to respond to numerous telephone calls and e-mails regarding IRB issues, questions about eligibility, and other aspects of the protocol. These calls have come primarily from individuals at Southwest Oncology Group institutions and women across the country who learn about the study from the Y-ME newsletter or internet home page, where the study is listed.
6. Regular communications were maintained between Dr. Gotay and the Project Team (including the Southwest Oncology Group Statistical Center, Operations Office, Y-ME, and the consultants). Monthly telephone conferences have been scheduled between Dr. Taylor at Y-ME, and weekly or more frequent e-mail or telephone communication with the Southwest Oncology Group Statistical Center (Ms. Lovato and Dr. Moinpour).
7. Dr. Gotay conducted a survey of all Southwest Oncology Group Community Clinical Oncology Programs (CCOPs) to learn more about any problems they may have been experiencing in activating, recruiting, or conducting the protocol. The survey indicated that most CCOPs were actively involved in promoting the study and did not identify any problems. The biggest continuing issue was the need to remind the oncology personnel about the availability of the study. The survey also reveals a few misunderstandings about the protocol that Dr. Gotay addressed through communication with the institutional personnel.
8. Two project group meetings were held in conjunction with Southwest Oncology Group meetings in San Antonio, Texas (October 1998) and Phoenix, Arizona (April 1999).
9. Presentations about the study were made by Dr. Gotay at the October 1998 Southwest Oncology Group Clinical Research Associate Plenary Session, October 1998 Clinical Research Associate roundtable and the April 1999 Breast Cancer Committee Meetings and Cancer Control Research Committee Meetings.
10. The Southwest Oncology Group Statistical Center developed a reminder system to remind institutional personnel about upcoming questionnaire completion dates for women registered at their institutions. This information is computer-generated and is transmitted to each institution on a monthly basis in the same way as is done for treatment studies.
11. Dr. Gotay and her staff developed a system to send mailed materials to institutions who have women who are in the control condition. The institutions distribute these materials to the women after they complete their final questionnaires.

#### **KEY RESEARCH ACCOMPLISHMENTS**

None, the project is not completed.

#### **REPORTABLE OUTCOMES**

None, the project is not completed.

## CONCLUSIONS

After a slower-than-expected start, the protocol is accruing at a steady rate. There is considerable enthusiasm for the research in the Group among behavioral scientists and clinicians alike, and women participating in the protocol have been highly supportive. Continued vigilance will be needed to keep the protocol salient in the minds of physicians, nurses, and data managers so that referrals will be maintained until study completion. Dr. Gotay and the project team will maintain efforts at publicizing the study, providing communications with Southwest Oncology Group institutions, and making presentations at the Group meetings to ensure that the study continues to have a high profile within the Group.

Oncology Group**  
A National Clinical Research Group

May 1, 1999

TO: ALL SOUTHWEST ONCOLOGY GROUP, CCOP AND CGOP MEDICAL ONCOLOGISTS

FROM: Jennifer S. Gazvoda, Protocol Coordinator

RE: **S9832**, "Enhancing Well-Being During Breast Cancer Recurrence." Study Coordinators: C. Gotay, Ph.D., C. Moinpour, Ph.D., K.S. Albain, M.D., S. Martino, D.O., B. Taylor, Ph.D.

---

**REVISION #5**

The Clinical Update Form has been revised to include space to indicate whether the assessment is obtained at Month 3 or Month 6 and the date of the assessment. The revised Clinical Update Form is now numbered as Form #49100 and replaces the 7/15/98 version (Form #4338). The form number change is reflected in Sections 14.5, 14.6 and 18.9.

Please append this notice to your copy of the protocol and replace pages 16, 23 and the Clinical Update Form.

This memorandum serves to notify the NCI and Southwest Oncology Group Statistical Center.

ONCOLOGISTS

FROM: Jennifer S. Gazvoda, Protocol Coordinator

RE: **S9832**, "Enhancing Well-Being During Breast Cancer Recurrence." Study  
Coordinators: C. Gotay, Ph.D., C. Moinpour, Ph.D., K.S. Albain, M.D., S.  
Martino, D.O., B. Taylor, Ph.D.

---

**REVISION #4**

Section 5.0 of the above-noted study has been revised to include space to indicate (1) the date the patient was informed of her first recurrence and (2) the date the patient is planning to begin her FIRST treatment for this recurrence. As a reminder, Section 5.0 must be completed and submitted to the Statistical Center within 14 days of registration. Sections 14 and 18 have been revised to include form numbers.

Please append this notice to your copy of the protocol and replace pages 6, 15, 16 and 23.

This memorandum serves to notify the NCI and Southwest Oncology Group Statistical Center.

RE: **S9832**, "Enhancing Well-Being During Breast Cancer Recurrence" Study  
Coordinators: C. Gotay, Ph.D., C. Moinpour, Ph.D., K.S. Albain, M.D., S. Martino, D.O., B. Taylor, Ph.D.

---

**REVISION #3**

The above-noted protocol has been revised to distinguish between the two packets of information that patients receive. The first is a packet compiled locally at the institution and includes: a copy of the National Cancer Institute (NCI) booklet, "When Cancer Recurs: Meeting the Challenge Again" and/or the Y-ME booklet, "I Still Buy Green Bananas" and a list of local and national agencies that provide cancer-related information and support. This basic information packet is given to all patients at baseline. The second packet is compiled by the Y-ME National Breast Cancer Organization and is distributed by Y-ME to patients on the intervention arm after the first telephone session rather than following each session. This standardized Y-ME packet is distributed by the Study Coordinator to patients on the control arm after the six month assessment has been received. The above-noted protocol has also been corrected to indicate that the Additional Concerns Form is completed by the patient rather than the nurse/CRA. These revisions are reflected in the Schema, Sections 7.2, 7.3, 9.0 and the Model Informed Consent form.

Section 7.1d has been revised to reflect that "the counselor will discuss a list of issues....where the patient has concerns." The last sentence of Section 10.3 has been deleted since it was redundant.

The CARES-SF Form was revised to indicate the Southwest Oncology Group Patient Number rather than the Southwest Oncology Group Study Number. The Quality of Life Cover Sheet was revised to specify that the Telephone Counseling Evaluation Form is to be completed at months three and six only. The section capturing reasons why the questionnaires may not have been completed has been revised.

Stephanie Green, Ph.D. has replaced Polly Feigl, Ph.D. as Secondary Statistician for this study. This change is reflected on the face page of the protocol.

Please append this notice to your copy of the protocol and replace pages 2, 7 - 9, 11, 13, 24, the face page, the CARES-SF Form and the Quality of Life Cover Sheet.

This memorandum serves to notify the NCI and Southwest Oncology Group Statistical Center.

Coordinators: C. Gotay, Ph.D., C. Moinpour, Ph.D., K.S. Albain, M.D., S.  
Martino, D.O., B. Taylor, Ph.D.

---

**REVISION #2**

The following revisions have been made to the above noted protocol:

Sections 5.3 and 5.5 have been combined into Section 5.3 to clarify eligibility with regard to prior treatment.

The NCI Cancer Information Service (CIS) phone number has been corrected in Section 7.2c and on the Support Services Form.

A statement has been added to Section II of the Model Informed Consent to indicate that the Study Coordinators and supervisors at Y-ME are the only people who will listen to the tapes and all tapes will be destroyed after they have been reviewed.

Question #32 on the CARES-SF Form has been corrected to read, "I have insurance problems" rather than "I have financial problems".

Please append this notice to your copy of the protocol and replace pages 6, 8, 24, the CARES-SF Form and the Support Services Form.

This memorandum serves to notify the NCI and Southwest Oncology Group Statistical Center.

## **SCHEMA**

### **Study Entry**

Patient signs informed consent and completes baseline questionnaires (CARES-SF, CES-D, Psychosocial Questionnaire, Support Services Form and the Additional Concerns Form)

Nurse/CRA completes baseline

- a. S9832 Prestudy Form
- b. Quality of Life Cover Sheet

Nurse/CRA gives all patients basic information packet to include booklets and a list of support services

### **Randomization**

#### **Control**

Standard level of support

Nurse/CRA mails questionnaires  
2 weeks prior to the 3 & 6 month  
assessments

Upon return of 3 & 6 month questionnaires,  
Nurse/CRA completes:

- a. S9832 Clinical Update Form
- b. Quality of Life Cover Sheet

Study Coordinator distributes standardized  
Y-ME packet of information to patient.

#### **Intervention**

Nurse/CRA faxes patient information to Y-ME

Y-ME contacts patient and conducts intervention  
[4 - 8 sessions over 4 weeks]

Y-ME sends standardized packet to patient

Nurse/CRA mails questionnaires (including  
Telephone Counseling Intervention Form) two weeks  
prior to the 3 & 6 month assessments

Upon return of 3 & 6 month questionnaires,  
Nurse/CRA completes:

- a. S9832 Clinical Update Form
- b. Quality of Life Cover Sheet

## 1.0 **OBJECTIVES**

- 1.1 To assess the effectiveness of a telephone intervention delivered by breast cancer survivors on well-being of patients experiencing a first recurrence of breast cancer.
- 1.2 To examine the impact of sociodemographic, clinical, and psychosocial predictors of well-being in patients experiencing a first recurrence of breast cancer.
- 1.3 To examine changes in well-being over time since recurrence.

## 2.0 **BACKGROUND**

### The Psychosocial Impact of Breast Cancer Recurrence.

Despite significant increases in five-year breast cancer survival rates, mortality curves for these patients have remained largely unchanged for many years. While many breast cancer patients, especially women diagnosed with Stage I disease, can realistically expect to be cured of their disease, significant numbers of patients will experience a recurrence of their breast cancer at some point following diagnosis, treatment, or a disease-free period. Although this statistic is not generally emphasized, when all stages of breast cancer are considered, as many as 50% of patients will experience recurrence.

Recurrence marks a significant change in the breast cancer care continuum, since it brings home the limits of current knowledge in oncology. The cancer care team must acknowledge that the treatment did not work: that all of the optimism, faith in medicine, and careful compliance with treatment were not enough to forestall disease progression. The patient and family may question whether all of the suffering that they have gone through was really worth it, and they may have a sense of failure: not only about treatment, but about themselves. They must deal with a new reality: that the patient is experiencing pain and other symptoms of her recurrence, that chances for cure have been reduced, and that once again, treatment decisions need to be made.

What is a woman's experience when the worst happens—that is, when breast cancer returns? Surprisingly, very little attention has been given to this issue in the literature: only nine studies have been reported about recurrence of any cancer during the past 15 years. (1) We do know that the patients identify the threat of recurrence as one of the most feared possible outcomes of cancer. The fear of recurrence repeatedly emerges as an important psychosocial theme in breast cancer patients who are newly-diagnosed, attending follow-up visits, and among long-term survivors. (2 - 5)

The largest study based on data from patients actually experiencing a recurrence is Worden's cross-sectional study of 102 individuals with recurrences of various cancers. (6 - 7) Worden found that distress levels of the patients with recurrence were high and equivalent to levels in newly-diagnosed patients. Compared to newly-diagnosed patients, the individuals in this study were less willing to participate in interventions focused solely on psychosocial counseling and more concerned about their medical problems and existential concerns. Among the factors that predicted higher distress were more symptoms, lack of social support, less hope, and being younger. Cella, Mahon, and colleagues also assessed adjustment in 40 patients within one month of recurrence; the patients represented a variety of cancer sites, and 27 were experiencing a first recurrence. (8 - 9) Patients in this study experienced high levels of distress: they "almost universally agree that recurrence is more upsetting than initial diagnosis". (8) There was a suggestion that having anticipated the possibility of recurrence aided adjustment: patients who reported that they were "completely surprised" by the recurrence fared the worst.

Several studies have focused on breast cancer recurrence. Silberfarb et al. compared psychosocial status in groups of breast cancer patients during initial diagnosis (N=50), first

recurrence (N=52), and metastatic disease (N=44). The findings indicated that the stage of first recurrence clearly was the most emotionally stressful time in their samples. (10) Significantly, only one woman out of the 52 could identify a single coping strategy she had found helpful, in marked contrast to the other two groups. In addition, the findings of this study illustrate how recurrence is often marked by physical impairment as well: 81% of the women in the recurrence group reported pain, the highest percentage of any group. Jenkins et al. evaluated 22 women with newly-diagnosed breast cancer recurrence, and found that 45% experienced depression and anxiety at the level of psychiatric diagnosis; previous psychiatric illness was a significant predictor of recurrence distress. (11) A recent study by Lewis and Deal further described problems in 15 married couples in which the wife was diagnosed with a recurrence of breast cancer. (1) A number of problems in marital adjustment were reported, as well as depression experienced by 40% of the women. The recurrence had been diagnosed a median of 10 months previously, indicating the long-lasting psychosocial impact of breast cancer recurrence and the potential that intervention could provide a real benefit for these patients.

#### Interventions to Reduce Psychosocial Distress.

No intervention directed at the needs of patients experiencing a recurrence of breast cancer (or any other cancer) has been reported. However, several reviews, including a recent meta-analysis, have concluded that psychosocial interventions have a positive impact on the well-being of patients across the spectrum of other disease sites and stages. (12 - 15) To date, research has not established whether one kind of intervention is more effective than another, or more appropriate for certain patients. A variety of intervention types (e.g., informational, psychological, behavioral, social support) and formats (e.g., group, individual, telephone) have demonstrated beneficial effects. Effects have been demonstrated for quality of life, symptom management, and psychological functioning. The optimal point to evaluate the impact of psychosocial interventions has not been firmly established. Most studies assess outcomes at one or more intervals during the first year post-intervention, although impacts may be long-lasting, even extending to ultimate survival. (12 - 14, 16)

This study will draw on an approach that has been found effective by a number of investigators: a brief, time-limited intervention combining information and support delivered by telephone. The telephone is frequently used in providing information regarding cancer treatment and counseling. (17) In particular, the telephone may make services available to individuals for whom traveling would pose difficulties because of geography, health, or access to transportation. Other cooperative groups, including the Eastern Cooperative Oncology Group and the Cancer and Leukemia Group B, are currently conducting research protocols utilizing telephone-delivered interventions. However, no other group has focused on patients with recurrence. In fact, patients with recurrence appear to have recourse to few specialized resources. Resource and support programs frequently offer assistance to newly diagnosed patients, hospice patients, and (increasingly) to survivors. Patients going through a recurrence seem to "fall between the cracks."

#### The Use of Lay Organizations to Provide Support to Breast Cancer Patients.

The intervention will be delivered by women who are particularly well-qualified to provide support and information: breast cancer survivors who have themselves experienced recurrence. A distinctive feature of this study is its delivery of the intervention through an established national breast cancer advocacy and support organization, Y-ME. Although Y-ME has provided telephone hotline services (using a toll-free 800 number) since 1987, the impact of the service has not been systematically assessed. This is also true for other lay programs for breast cancer patients, such as the American Cancer Society's Reach-to-Recovery program. (23) This study will utilize breast cancer survivors within the context of a structured protocol, as well as standardized and validated outcome measures. If the program proves effective, it can become part of Y-ME's program and be delivered on a standard basis. The use of a voluntary organization staffed with non-health professionals represents a cost-effective approach to providing support. Y-ME has participated in a Southwest Oncology Group Lay Advisors/Advocates Steering Committee for the past two

years. The lay advisors (who include representatives of national organizations and volunteers selected through a nationwide search) are special members of the Group, serve as members of Disease and other Committees (including the Committee on Women's Health and the Breast Cancer Committee), and attend semi-annual Group meetings. The lay advisors contributed to the development and design of this protocol.

This study will provide information about how to improve well-being during a portion of the breast cancer trajectory where little attention has been focused. The project utilizes a cost-effective approach to intervention with demonstrated usefulness in cancer patients. The intervention will be delivered by individuals who are especially well-qualified to provide support: women who themselves have experienced breast cancer recurrence. This project represents one of the first formal research collaborations between a clinical cooperative research group and a lay breast cancer organization. Southwest Oncology Group staff will be responsible for having patients complete the baseline assessment package in the clinic, for mailing follow-up questionnaires, and for monitoring the return of questionnaires from patients. The project reflects the overriding motivation of both groups: to provide the best possible care and support to cancer patients.

This study was designed to include minorities, but was not designed to measure differences of intervention effects.

### **3.0 DRUG INFORMATION**

There is no drug information for this study.

### **4.0 STAGING CRITERIA**

There are no staging criteria for this study.

## 5.0 ELIGIBILITY CRITERIA

Each of the criteria in the following section must be met in order for a patient to be considered eligible for registration. Use the spaces provided to confirm a patient's eligibility. For each patient, this section must be photocopied, completed and submitted to the Statistical Center (see Section 14.4).

**SWOG Patient No.** \_\_\_\_\_

**Patient's Name** \_\_\_\_\_

- \_\_\_\_\_ 5.1 Patient must have received definitive surgical treatment for Stage I, II or IIIa breast cancer, with or without adjuvant chemotherapy, hormonal therapy and/or radiation therapy.
- \_\_\_\_\_ 5.2 Patient must have been informed of her first recurrence of breast cancer within the past 56 days. "First recurrence" is defined as any distant metastatic site, or chest wall recurrence, or scar recurrence, or nodal recurrence. Ipsilateral breast tumor recurrence following lumpectomy, and isolated contralateral new primary breast cancers are excluded. NOTE: We suggest not approaching the patient within the first three weeks post-diagnosis. See Section 7.1 for further suggestions about approaching the patient.
- Date patient informed of her first recurrence \_\_\_\_\_
- \_\_\_\_\_ 5.3 Patients may be receiving or planning to receive their FIRST treatment for this recurrence. Patients who have completed their first regimen for this recurrence are not eligible. Exceptions: Patients may have had prior surgical treatment for in-breast relapse following lumpectomy, and patients may have completed local palliative RT.
- Date patient to begin her FIRST treatment for this recurrence \_\_\_\_\_
- \_\_\_\_\_ 5.4 Patients must be female.
- \_\_\_\_\_ 5.5 Patients must not have a current psychiatric diagnosis that would interfere with their ability to participate in the intervention.
- \_\_\_\_\_ 5.6 Patients must be able to read and understand English.
- \_\_\_\_\_ 5.7 Patients must have completed the baseline packet of questionnaires (CARES-SF, CES-D, Psychosocial Questionnaire, and Support Services Form) within 7 days prior to registration in order to be eligible.
- Date questionnaires completed \_\_\_\_\_
- 5.8 If Day 7 falls on a weekend or holiday, the limit may be extended to the next working day.
- In calculating days of tests and measurements, the day a test or measurement is done is considered Day 0. Therefore, if a test is done on a Monday, the Monday one week later would be considered Day 7. This allows for efficient patient scheduling without exceeding the guidelines.**
- \_\_\_\_\_ 5.9 All patients must be informed of the investigational nature of this study and must sign and give written informed consent in accordance with institutional and federal guidelines.
- \_\_\_\_\_ 5.10 At the time of patient registration, the date of institutional review board approval for this study must be provided to the Statistical Center.

## **6.0 STRATIFICATION/DESCRIPTIVE FACTORS/ RANDOMIZATION SCHEME**

Participants will be randomly assigned to one of two arms: (a) intervention; or, (b) control. This randomization will be dynamically balanced with respect to the following stratification factors, using the method of Pocock and Simon: (24)

- a. Age (< 50 vs. ≥ 50)
- b. Time since initial diagnosis (< 2 years vs. ≥ 2 years)
- c. Recurrence site (soft tissue without bone vs. soft tissue with bone vs. visceral)

NOTE: Visceral takes precedence. The first two categories are only applicable if there is no visceral involvement.

## **7.0 TREATMENT PLAN**

### **7.1 Approaching Patients for This Study**

- a. We recommend that you do not approach women about participating in this study during the first three weeks after they have been informed about the recurrence. The patient may not be ready to consider an intervention at this time. If after three weeks, the patient still says no, wait a few weeks longer and ask her again.
- b. Explain that this study is comparing the kind of support women seek on their own when informed about a recurrence versus a special program that both organizes existing support and tailors help to the needs of the individual woman.
- c. Since we do not know if this special program really does help women more than what they do on their own, we need a "control" group. Women in the control group will continue to make use of existing sources of support. At the end of their study participation (in six months), these women will receive all materials developed for the special counseling group.
- d. If randomized to the special counseling program, the patient will be called between four to eight times by a breast cancer survivor who volunteers at Y-ME. Some of these counselors have also had a recurrence. The counselor will discuss a list of issues and problems faced by other women diagnosed with a recurrence, including any area where the patient has concerns. Patients will select which topics they want to spend more time discussing. That is, patients decide to have shorter or longer sessions as long as no more than eight calls occur.

### **7.2 Main Study Procedures**

- a. Prior to randomization, all patients will complete baseline questionnaires: CARES-SF, CES-D, Psychosocial Questionnaire, the Support Services Form and the Additional Concerns Form (see Section 18.0).
- b. The nurse or CRA will complete the S9832 Prestudy Form and the Quality of Life Cover Sheet for the patient questionnaires.
- c. Each institution will provide all patients with a packet of basic information after the baseline questionnaires have been completed. This packet of basic information is compiled locally and should include a copy of the National Cancer Institute (NCI)

booklet, "When Cancer Recurs: Meeting the Challenge Again" (call 1-800-4-CANCER for copies) and/or the Y-ME booklet, "I Still Buy Green Bananas" (call Y-ME 312/986-8338). A list of local and national agencies [e.g., Y-ME, other advocacy groups, American Cancer Society, NCI Cancer Information Service (CIS)], that provide cancer-related information and support, should also be prepared and included in the basic information packet distributed to all study participants. Addresses and/or phone numbers should also be provided. The baseline questionnaires should be completed before a study patient is given the pamphlet(s) and list of resources.

- d. The CRA or nurse will phone and fax the names and telephone numbers for patients randomized to the **intervention group only** to Y-ME, so that the Y-ME peer counselor can initiate the intervention. The patients will be informed that a Y-ME peer counselor will be calling in the next few days to begin the intervention.
- e. The CRA will inform all patients that they will be mailed questionnaires at two follow-up points after randomization: three months and six months; a self-addressed, stamped envelope will be included for return to the treating institution. The follow-up questionnaires include the CARES-SF, the CES-D, the Support Services Form, the Telephone Counseling Evaluation Form (for patients on the intervention arm) and the Additional Concerns Form. Follow-up questionnaires should be mailed two weeks prior to the scheduled assessment.
- f. The S9832 Clinical Update Form and the Quality of Life Cover Sheet for the patient-completed questionnaires should be completed by the nurse or CRA. If the questionnaires are not received within one week after the scheduled assessment, the nurse or CRA should call and remind the patient to submit the questionnaires to the institution. The nurse or CRA should still complete and submit the Cover Sheet for the questionnaires and the Clinical Update Form to the Statistical Center, even if the patient does not submit her questionnaires.
- g. The CRA or nurse should call the patient at Month 3 and at Month 6. The CRA or nurse should ask if the patient has received the questionnaires. If the patient has the questionnaires, a time for a telephone interview should be arranged; ask the woman to complete the questionnaires prior to the date. At the time the telephone interview occurs, the CRA or nurse should go over each questionnaire, asking the patient if she has answered all questions. The CRA or nurse should ask each question on the Telephone Counseling Evaluation Form, encouraging the patient to note positive and negative views about the intervention. The patient should be directed to return the envelope with the questionnaires to the treating institution.

### 7.3 The Telephone Intervention

Patients in the intervention group will receive four to eight counseling/information sessions delivered by telephone at weekly intervals; at least one call and no more than two calls will occur per week. A standardized intervention protocol will be used, with the time of each session decided by the patient and counselor. Each session will focus on different problem areas from the group listed below. Each patient will be given a choice about the order in which the sessions are presented, allowing each woman to prioritize her own concerns.

The content of the intervention sessions is as follows:

Get acquainted; provide overview of sessions; set priorities and order for the topics to be discussed.

Physical problems: symptom control, treatment issues.

Social support: understanding reactions of other people, how to build a social support network.

Existential concerns: spiritual concerns, activities that may be helpful (e.g., recording one's own oral history), the importance of hope.

Stress management: approaches that may be helpful, including relaxation, visualization, exercise (with physician supervision), healthy eating.

Closure and debriefing.

Each session will provide basic information and an opportunity for the patients to discuss individual concerns. The general format for the intervention sessions will be to provide information in specified areas, active listening when the women discuss their concerns, assistance in problem-solving (particularly to help the women define and prioritize their own solutions to problems), and information about resources that may be helpful (books and other written or audiovisual materials, local resources). Patients will be provided with information about local or national resources, addressing areas of concern as appropriate.

**The intervention is not designed to provide psychotherapy.** Instead, the Y-ME peer counselors will provide information, peer support, and referrals to community organizations. Procedures currently in place at Y-ME will be used if serious psychological disturbance is detected during a telephone session. In such cases, patients will be asked if the Y-ME peer counselor may contact the Southwest Oncology Group physician who enrolled her on the study.

After the first session, the patients will be sent a standardized packet of written or audiovisual materials to reinforce what was discussed during the session and provide additional information. The Study Coordinator will send the women in the Control arm the standardized Y-ME packet of written materials after the six month assessment has been received.

- 7.4 Women may withdraw from this study at any time should they wish to do so. Please document the reason for withdrawal on the Quality of Life Cover Sheet submitted with each of the three sets of questionnaires.

7.5 Patients will go off study after six months (see Section 14.7). No further follow-up will be required.

**8.0 DOSAGE MODIFICATIONS AND TOXICITIES TO BE MONITORED**

There are no dose modifications or toxicities associated with this study.

**9.0 STUDY CALENDAR "Enhancing Well-Being During Breast Cancer Recurrence"**

REQUIRED STUDIES	PRE STUDY	Wk 1	Wk 2	Wk 3	Wk 4	Mo 3	Mo 6
<b>ASSESSMENTS <math>\Omega</math></b>

Telephone Counseling Sessions		X $f$	X $f$	X $f$	X $f$		

$\Omega$  Forms are found in Section 18.0. (See Section 14.0 for data submission guidelines and Section 15.0 for QOL Assessment instructions.)

$f$  Intervention arm patients only. Four to eight sessions can occur during the four week period.

$\pi$  See Section 7.2c.

$\yen$  The standardized Y-ME packet will be sent by Y-ME to women on the intervention arm after the first session. This packet will be sent by the Study Coordinator to women on the Control arm after the six month assessment has been received.

## 10.0 MEASUREMENTS OF EFFICACY AND ENDPOINT DEFINITIONS

- 10.1 The primary outcome is well-being (CARES-SF psychosocial functioning and depression) three months post-enrollment on the study.

a. CARES-SF Psychosocial score of  $\geq .615$

The Cancer Rehabilitation Evaluation System - Short Form (CARES-SF) yields both a total score and five subscales: physical aspects, psychosocial concerns, medical interaction, marital problems, and sexual issues. It is a newly developed, brief form of the CARES. (25 - 26) Data supporting the measurement properties of this questionnaire are primarily documented for the long form (i.e., the CARES). However, the CARES-SF correlates well with the CARES. (25) In a number of studies, the full CARES has been shown to be valid and reliable. (27 - 32) It differs from other quality of life instruments by providing more concrete information about patient experiences. Normative information is available, including a recent study in breast cancer survivors one, two, and three years post-diagnosis, which demonstrates that the CARES is responsive to change. (32)

The CARES-SF contains a minimum of 38 and a maximum of 57 items. The exact number varies because of skip patterns related to patient-specific experiences. Respondents rate how great a problem they find in specified areas on five-point scales. (25) A CARES Psychosocial score of .615 or greater has been found to correctly classify breast cancer patients "at risk" for psychosocial distress, as identified in a comprehensive clinical interview by a social worker. The estimated probability of classifying women in the high risk group was .81 in a recursive partitioning model. (30) Given the correlation between the CARES and the CARES-SF, we will use a CARES-SF cutoff score of .615.

b. Depression. Depression will be assessed by a score above 16 on the Center for Epidemiological Studies - Depression (CES-D) scale. (1, 33 - 38)

The CES-D has been extensively used in both community and patient populations, including cancer patients. (1, 33 - 38) It includes 20 symptom-related items. Respondents rate the frequency of having experienced these symptoms during the past week on four point scales. In many studies, the scale has been shown to distinguish reliably among in-patient populations and to be sensitive to changes over time. The interpretation of scores is also facilitated by a score "cutoff" of 16 (which reflects that 6 of 20 symptoms are at least moderately persistent). Persons scoring above this cutoff are likely to be classified as clinically depressed when they receive a full clinical evaluation. In this study, the CES-D will be used to designate patients who score above (at risk of depression) or at or below the cutoff score (not at risk of depression).

- 10.2 Longer-term quality of life. Scores for the two quality of life endpoints described above will also be examined at 6 months post study entry. The CARES-SF total score will also be examined at 3 and 6 months.

- 10.3 Evaluation of Intervention. The intervention will be evaluated through scores on the Telephone Counseling Evaluation Form at 3 months.

The Telephone Counseling Evaluation Form will provide information about the patient's overall appraisal of the intervention, primarily to provide concrete information about what the participants found helpful, and what areas could be improved to aid in future interventions. At study entry, 3 months and 6 months, all patients will also complete the Support Services Form regarding their use of community services and other forms of assistance (e.g., support groups, church groups, counseling) during the previous six months, and whether they have used Y-ME resources. Since Y-ME has a national

hotline, it is possible that patients in either group could call Y-ME for (additional) assistance. Patients in the intervention group will not be able to access their peer counselor delivering the intervention except during the scheduled sessions.

10.4 Psychosocial Predictors. A Psychosocial Questionnaire will be used to examine possible predictors of well-being. These include:

- a. Social support will be measured by the total score on Reynolds et al.'s four-item scale found to predict breast cancer survival. (39)

- b. Optimism-pessimism

Optimism-pessimism will be measured by using the total score on the Life Orientation Test (LOT). This 8-item scale has been demonstrated to have high levels of internal consistency and test-retest validity in breast cancer patients. (40) In a recent study, Carver et al. found that scores on this scale predicted breast cancer survival. (41)

- c. Surprisingness of the recurrence

How surprising the recurrence was will be measured by the score on a single question. Cella et al. found this question correlated with recurrence distress. (8)

- d. Sense of Coherence

The meaning of their recurrence to the patients will be measured by the total score on Antonovsky's Sense of Coherence Scale (SOC); this is one of the few available scales to focus on existential concerns. (42) We will use the short form of this scale (13 items), which has demonstrated high internal consistency and construct validity. (43 - 44)

10.5 Current Cancer Treatment. A form will be used to ascertain current cancer treatments at study entry (S9832 Prestudy Form), and at 3 and 6 months (S9832 Clinical Update Form). This information may help to identify subgroups of interest (e.g., women who receive high dose chemotherapy with stem cell support).

## 11.0 STATISTICAL CONSIDERATIONS

- 11.1 Sample size: 300 patients will be randomly assigned to either the intervention or control group in order to yield 255 study participants at the 3-month evaluation point. This estimate is based on previous Southwest Oncology Group studies which include repeated quality of life questionnaires with a completion rate in excess of 85%. (45)

- 11.2 Power Calculations: Primary Analyses. Power calculations indicate that a sample size of 255 at three months is sufficient to test intervention versus control group differences outlined below for the two primary endpoints: 3-month CARES-SF Psychosocial Summary cut-off score and 3-month CES-D cut-off score. All estimates use one-tailed tests. An alpha level of .025 (.05 divided by 2) will be used to adjust for the two planned comparisons.

CARES-SF Psychosocial Summary Cut-off Score. Patients with a 3 month CARES-SF psychosocial summary score greater than or equal to .615 will be considered at risk for

psychosocial distress, whereas patients with a psychosocial score less than .615 will be considered not at risk. Fifty percent of patients on the control arm are expected to have subscale scores above .615, whereas a smaller proportion of intervention arm patients should score above .615 on this subscale. Table 1 shows the power the study has to detect group differences based on varying percentages of patients at risk.

**CES-D Score.** Patients with a 3 month CES-D score greater than 16 will be considered at risk for depression, whereas patients with a CES-D score less than or equal to 16 will be considered not at risk. A recent study by Lewis and Deal found that 40% of 15 women with a breast cancer recurrence had CES-D scores above 16. (1) The patients in this study were a median of 10 months post-recurrence diagnosis. Given that the women in this study will be newly diagnosed with recurrence, we expect that at least 40% of the control group to score "at risk," with the proportion at risk more likely to be 50 or 60%. We expect patients in the intervention arm to be significantly more likely to have scores below the cutoff. Table 1 provides power to detect group differences.

Table 1:

**Power to Detect Group Differences Based on Varying percentages of Patients**

Percentage of Patients:* Intervention Group	Percentage of Patients:* Control Group	Power
.20	.40	.90
.29	.50	.90
.39	.60	.90
.44	.65	.90

\*Percentages represent patients who score above the cutoff (.615 for the CARES-SF Psychosocial Summary score, 16 for the CES-D)

- 11.3 **Secondary Analyses.** The CARES-SF Mean Score (total score) will be used to explore whether patients receiving the telephone intervention show mean improvement in overall quality of life than patients not receiving the intervention. Descriptive statistics for patients' sociodemographic and clinical information and psychosocial predictors will also be reported along with the 3 and 6 month descriptive results for the primary endpoints. The three well-being scales will be used as dependent variables in regression analyses to explore the effect of sociodemographic, clinical, and baseline psychosocial predictors on the efficacy of the intervention. Logistic regression will be used to examine the predictors for scoring above or below the cutoffs on the CARES-SF psychosocial summary score and the CES-D scores. Least-squares regression will be used to examine the predictors for the CARES-SF total score. Independent predictors considered will include sociodemographics (age, education, marital status, ethnicity), clinical variables (stage of disease, time since diagnosis, site of recurrence, treatments received, history of psychiatric dysfunction) and psychosocial predictors (social support, optimism-pessimism, how surprising the recurrence was, sense of coherence). Both univariate analyses and stepwise regression will be used to investigate the relationships among the predictors and the endpoints in order to identify a more parsimonious group of predictors. In addition, statistical methods for the exploration of longitudinal data will be applied to model within-patient changes in scores over time. (46 - 49)

- 11.4 Study Duration. Accrual for this study is 30 months, with an expected accrual rate of 10 patients per month.

## **12.0 DISCIPLINE REVIEW**

There is no discipline review in conjunction with this study.

## **13.0 REGISTRATION GUIDELINES**

- 13.1 All patients will be registered with the Southwest Oncology Group Statistical Center by telephoning 206/667-4623, 6:30 a.m. to 5:00 p.m. Pacific time, Monday through Friday, excluding holidays. Patients must be registered prior to the initiation of treatment (no more than one working day prior to submitting the fax to Y-ME - see Section 7.0).
- 13.2 At the time of registration, the caller must have completed the Registration Form.
- 13.3 The caller must also be prepared to provide the date of institutional review board approval for this study. Patients will not be registered if the IRB approval date is not provided or is > 1 year prior to the date of registration. The caller must also confirm that a list of local resources to provide support to breast cancer patients is available at the institution.
- 13.4 Exceptions to the current registration policies will not be permitted. Therefore, exceptions to eligibility requirements, participation by an institution/member not identified as eligible AND/OR cancellations will not be allowed.

## **14.0 DATA SUBMISSION SCHEDULE**

- 14.1 Data must be submitted according to protocol requirements for **ALL** patients registered, whether or not intervention sessions are completed, including patients deemed to be ineligible.
- 14.2 Master forms are included in Section 18.0 and (with the exception of the sample consent form) must be photocopied for data submission to the Statistical Center.
- 14.3 Group members and CCOPs must submit one copy of all data forms directly to the Statistical Center in Seattle. CGOPs must submit (number of copies to be determined by the Group member) copies of all forms to their Group institution for forwarding to the Statistical Center.
- 14.4 WITHIN 14 DAYS OF REGISTRATION:
- Submit a copy of the following:
- Registration Form (Form # 32379).
  - Completed copy of Section 5.0 including patient identifiers.
  - Pre-registration CARES-SF (Form # 2836), CES-D (Form # 55532), Support Services Form (Form # 48909), Psychosocial Questionnaire (Form # 19092), S9832 Prestudy Form (Form # 45674), Quality of Life Cover Sheet (Form # 40404) and Additional Concerns Form (Form # 609).

**14.5 AFTER THE MONTH 3 ASSESSMENT:**

For all patients: submit the Quality of Life Cover Sheet (Form # 40404), Additional Concerns Form (Form # 609), S9832 Clinical Update Form (Form # 49100), CARES-SF (Form # 2836), CES-D (Form # 55532), and Support Services Form (Form # 48909).

For patients on the intervention arm only: submit the Telephone Counseling Evaluation Form (Form # 57890).

**14.6 AFTER THE MONTH 6 ASSESSMENT:**

For all patients: submit the Quality of Life Cover Sheet (Form # 40404), the Additional Concerns Form (Form # 609), S9832 Clinical Update Form (Form # 49100), CARES-SF (Form # 2836), CES-D (Form # 55532), and Support Services Form (Form # 48909).

For patients on the intervention arm only: submit the Telephone Counseling Evaluation Form (Form # 57890).

**14.7 WITHIN 14 DAYS AFTER THE MONTH 6 ASSESSMENT OR OFF STUDY FOR ANY REASON:**

Submit a copy of the Off Treatment Notice (Form # 25524).

**15.0 SPECIAL INSTRUCTIONS FOR SOUTHWEST ONCOLOGY GROUP NURSES OR CRAs**

[Note: Southwest Oncology Group nurses and CRAs have responsibility for collecting outcome data for this study. The psychosocial intervention will be delivered by Y-ME, a national breast cancer advocacy and support organization.]

**15.1 Assessment Schedule**

For both arms, the QOL questionnaires must be completed as follows:

- a. within seven days prior to randomization (Pre-registration Assessment),
- b. month 3,
- c. month 6.

The Psychosocial Questionnaire is administered only at study entry. Follow-up questionnaires must be completed at home and returned by mail. Only patients in the intervention arm must complete a Telephone Counseling Evaluation Form at 3 and 6 months.

**15.2 General Instructions**

- a. Remind patients to answer the questions with their first impression and not to spend a lot of time thinking about each question. Remind patients that there are no right or wrong answers for questions addressing patient quality of life. We are interested in their idea or sense about how they are doing.
- b. Stress the importance of the quality of life questionnaires for learning more about the problems women face when they have a recurrence. This information can help us design better support programs for future patients.

### 15.3 Maintaining the QOL Follow-up Assessment Schedule

- a. When a patient is randomized to **S9832**, a confirmation of registration with all follow-up QOL assessment dates will be sent to the investigator under whose name the patient was registered. The nurse or CRA should put a copy of these scheduled dates in the patient's folder as a reminder of when to have the patient complete QOL questionnaires.
- b. Pre-registration assessments are obtained in the clinic. Make certain that the patient understands how to complete all forms before she leaves the clinic since follow-up questionnaires will be completed at home and mailed to the Southwest Oncology Group institution.
- c. Two weeks prior to the 3 and 6 month assessments, mail the questionnaire packets to the patient, and call to remind her of the scheduled assessment. Only patients in the intervention arm should receive the Telephone Counseling Evaluation Form.
- d. If a patient refuses or cannot complete the QOL questionnaires for some reason, then this must be documented on the Quality of Life Cover Sheet and mailed to the Statistical Center as soon as this information is known.
- e. If a patient refuses or cannot complete the QOL questionnaire at one time point, she should be asked to do so at the next scheduled administration time.
- f. Questionnaires should be completed even if an intervention arm patient does not complete the intervention, if the patient is willing.

### 15.4 Standardizing the Administration of Questionnaires

- a. Please read all instructions to the patient that are part of the QOL Questionnaires. Make certain that the patient understands the different sections of the questionnaire, as the format for providing answers varies. For example, in the CARES-SF, ensure that the patient understands the concept of skip patterns (if the answer to a question is no, skip to item ---). Explain the specific administration times for this protocol. It should take approximately 20 minutes for the patient to complete the questionnaire.
- b. Patients should be directed to report all symptoms and limitations whether or not related to the cancer or its treatment.
- c. When questionnaires are completed in your presence, it is permissible to assist the patient with completing the questionnaire, being careful not to influence the patient's response. Note on the Cover Sheet what assistance was required and indicate the reason (e.g., forgot glasses, too sick, etc.). Discourage family members from 1) being present while the patient completes the questionnaire and/or 2) influencing patient responses. The Southwest Oncology Group QOL Assessment Training Video available to all Southwest Oncology Group institutions provides guidance in this area.

### 15.5 Additional Quality Control Issues

- a. It is very important to review the questionnaire after the patient has completed the form to be sure all of the questions have been answered, and that only one answer has been marked. For mailed follow-up questionnaires, it is important to review the mailed questionnaires as soon as they arrive.
- b. If the patient has marked more than one answer per question, ask the patient which answer best reflects how she is feeling. For mailed questionnaires, a

phone call can be made to the patient to clarify the multiple response. Once the patient has selected one response, mark this clearly on the questionnaire and put your initials and the date.

- c. If the patient has skipped a question, inform the patient that the question was not answered, and ask if she would like to answer it. Always give the patient the option to refuse. Make a note in the margin by the particular item that the patient did not want to answer this question. This issue can also be clarified by phone if the questionnaire was mailed.
  - d. For each scheduled QOL assessment, complete a cover sheet, attach it to the QOL questionnaires, sign it, and mail it on the day the data are obtained from the patient (or the day you receive the data by mail). See Section 14.0 for data submission guidelines. The person signing the Cover Sheet (or the person who registered the patient) may be called if there are questions regarding QOL questionnaires or cover sheets. For mailed questionnaires, attach a cover sheet to the questionnaires and check the "Other" category under where the questionnaires were administered. If questionnaires were not completed, return the Cover Sheet, indicating the reason for the missing questionnaires.
  - e. The QOL liaison or one oncology nurse or CRA from any institution registering patients on S9832 must attend one QOL assessment training session held at each of the biannual Southwest Oncology Group meetings. Most data management institutions have received a copy of the QOL Assessment Training Video. If your institution does not have a copy, please contact the data management institution to which you submit data to and borrow their copy, or contact the Operations Office to request a copy. The training video helps standardize instructions for obtaining the QOL data and handles staff turnover training needs between Southwest Oncology Group meetings.
- 15.6 When the patient's questionnaires are received, the CRA or nurse should note in the forms any questions that the patient did not want to answer.
- 15.7 Questions regarding QOL assessments can be directed to the Study Coordinator, Carolyn Gotay, Ph.D. (808/586-2975) or Carol M. Moinpour, Ph.D. at the Statistical Center (206/667-4623).
- 15.8 Identification and Training of Women to Deliver the Intervention:
- a. Women will be recruited to be peer counselors through Y-ME's current screening, interview, and assessment procedures. Additional criteria for peer counselors are one or more breast cancer recurrences and a score less than 16 on the CES-D.
  - b. The peer counselors will attend a training course in how to deliver the intervention.
  - c. The training program for the individuals delivering the intervention will be based on Y-ME's current training model, which covers counseling skills, Y-ME Hotline volunteer regulations, and related medical information (glossary of medical terms, supplemental readings such as the PDQ for breast cancer) and a take-home exam.
  - d. The Y-ME quality assurance program includes a test scenario (where the peer counselor conducts a sample interview in the presence of the supervisor) and an evaluation of actual performance (through a simulated breast cancer patient

telephone call made by a supervisor). These procedures will be maintained, with the quality assurance testing occurring annually.

- e. The trainees will be provided with National Cancer Institute materials regarding recurrence and clinical trials.
- f. The trainees will be required to pass an exam before they can provide the intervention.
- g. The peer counselors will be required to complete 6 hours of continuing education per year.

#### **16.0 ETHICAL AND REGULATORY CONSIDERATIONS**

The following must be observed to comply with Food and Drug Administration regulations for the conduct and monitoring of clinical investigations. They also represent sound research practice:

##### **Informed Consent**

The principles of informed consent are described by Federal Regulatory Guidelines (Federal Register Vol. 46, No. 17, January 27, 1981, part 50) and the Office for Protection from Research Risks Reports: Protection of Human Subjects (Code of Federal Regulations 45 CFR 46). They must be followed to comply with FDA regulations for the conduct and monitoring of clinical investigations.

##### **Institutional Review**

This study must be approved by an appropriate institutional review committee as defined by Federal Regulatory Guidelines (Ref. Federal Register Vol. 46, No. 17, January 27, 1981, part 56) and the Office for Protection from Research Risks Reports: Protection of Human Subjects (Code of Federal Regulations 45 CFR 46).

##### **Adverse Experiences**

There are no commercial or investigational agents used in conjunction with this study.

**18.0 MASTER FORMS SET**

- 18.1 This section contains the Model Informed Consent Form. The consent form must be reviewed and approved by the Institutional Review Board prior to registration of patients on this study.
- 18.2 Southwest Oncology Group Registration Form (Form # 32379)
- 18.3 CARES-SF (Form # 2836)
- 18.4 CES-D (Form # 55532)
- 18.5 Support Services Form (Form # 48909)
- 18.6 Psychosocial Questionnaire (Form # 19092)
- 18.7 Quality of Life Cover Sheet (Form # 40404)
- 18.8 S9832 Prestudy Form (Form # 45674)
- 18.9 S9832 Clinical Update Form (Form # 49100)
- 18.10 Telephone Counseling Evaluation Form (Form # 57890)
- 18.11 Additional Concerns Form (Form # 609)
- 18.12 Off Treatment Notice (Form # 25524)

This model informed consent form has been reviewed by the DCT/NCI and is the official consent document for this study. Local IRB changes to this document are allowed. (Institutions should attempt to use sections of this document which are in bold type in their entirety.) Editorial changes to these sections may be made as long as they do not change information or intent. If the institutional IRB insists on making deletions or more substantive modifications to the risks or alternatives sections, they may be justified in writing by the investigator and approved by the IRB. Under these circumstances, the revised language, justification and a copy of the IRB minutes must be forwarded to the Southwest Oncology Group Operations Office for approval before a patient may be registered to this study.

**CONSENT FORM AND INFORMATION ABOUT**

**S9832 "Enhancing Well-Being During Breast Cancer Recurrence"**

**TO BE CONDUCTED AT**

\_\_\_\_\_  
\_\_\_\_\_

- I. **You are invited to take part in this research study because you have breast cancer that has come back after previous treatment. The purpose of this study is to learn how to help breast cancer patients to deal with the stresses of recurrence. This study is comparing whether a special program that offers assistance by phone from a breast cancer survivor is more helpful than what women do on their own.**

**We cannot and do not guarantee you will benefit if you take part in this study. If you take part in this study, the program may help you better cope with the stress of this time.**

- II. First, you will be asked to complete several questionnaires. The questions ask about how you are feeling and problems you may have experienced related to your cancer. They will take about 45 minutes to complete.

You will be randomly assigned to "standard care" or the telephone counseling program. Random assignment is similar to flipping a coin. You will have a equal chance of being in either group. By "standard care", we mean the support you seek on your own through your hospital, home health care providers, family, and friends. If you are in the telephone counseling group, you will have the opportunity to talk with a "peer counselor". A peer counselor is a woman who, like you, has had breast cancer and may also have had a recurrence of her breast cancer. Your peer counselor will call you on the telephone for four to eight sessions over a four-week period. The number of sessions will be decided by you and the counselor, but at least one session will occur each week. Some of these sessions may be taped to help train the peer counselors. The Study Coordinators and supervisors at Y-ME are the only people who will listen to the tapes. All tapes will be destroyed after they have been reviewed. Your counselor will discuss concerns that women with breast cancer recurrence often have. You will have a chance to ask questions and talk with her. These sessions could cover any of the following: physical problems, social support, spiritual concerns and/or stress management. She will be calling from the Y-ME national offices. Y-ME is a national organization that gives support to breast cancer patients. The length of the sessions will be your decision, depending on which topics you wish to discuss in more detail. That is, you can have four longer calls or six shorter calls or some combination. Your peer counselor has received special training so that she can offer up-to-date information. She will mail you a packet of materials after the first session. (12/1/98)

Initial of Witness: \_\_\_\_\_

Date : \_\_\_\_\_

Initial of Subject : \_\_\_\_\_

Date: \_\_\_\_\_

We'll ask you to fill out a survey two and five months after the last session of the program. The survey asks how you are doing. This information will help us to learn whether the program is helpful and would be useful for future patients. For women who took part in the program, we will also ask what you thought of it. A Clinical Research Associate at your hospital will contact you to give you the survey. Filling it out should take half an hour or less. After the last questionnaire, the women who received standard care will receive the same packets of materials that the women in the program received earlier.

This study and these materials will be provided at no cost to you.

- III. **You may be asked to answer questions about private matters, which could cause you to feel a loss of privacy. It is possible that the program, or answering questions about how you are doing could make you feel uncomfortable, and you are encouraged to talk about this with the peer counselor and Clinical Research Associate. You may also skip any questions you prefer not to answer and you are free to stop your participation at any time.**
- IV. **There may be other solutions for your stress, such as participating in other counseling programs or support groups. It is not known if the support you receive will offer any increased benefit than that currently available outside of participation in this research. If you feel you need additional support, please contact the physician or Clinical Research Associate who referred you to this study for a list of local resources. The costs of participating in other counseling programs or support groups will be your responsibility.**
- V. We will keep any information we learn from this study confidential and disclose it only with your permission. By signing this form, however, you allow us to make your records available to the National Cancer Institute, the U.S. Army Medical Research and Materiel Command and the Southwest Oncology Group. If we publish the information we learn from this study in a medical journal, you will not be identified by name. You may request a copy of the study results after the study is finished.
- VI. In the event of injury or illness resulting from the research procedures, emergency medical treatment will (or will not) be provided without cost. Continuing medical care and/or hospitalization will not be provided free of charge but must be paid for in the same way your regular medical care is paid. The Quality of Life Questionnaire and routine follow-up by the nurse will be provided to you free of charge. We cannot pay you to take part in these studies. The parts of the research consisting of keeping research records will be paid by those organizing and conducting the research.
- VII. Whether or not you take part in this study will not affect your future relations with your doctors (there will be no loss of benefit or change in attitude) or \_\_\_\_\_ (hospital name). If significant new findings are developed during the course of this study which may relate to your willingness to continue, this information will be provided to you. In addition, you understand that you may refuse to continue on this study at any time, without fear of prejudice to additional treatment that may be needed.

**INSTRUCTIONS:**

The following is a list of Problem Statements that describe situations and experiences of individuals who have or have had cancer. Read each statement and mark an ☒ in the box that best describes **HOW MUCH EACH STATEMENT APPLIES TO YOU** during the **PAST MONTH, INCLUDING TODAY**. Some sections will not apply to you. Please skip these sections and proceed to the next one as directed.

**EXAMPLE:**

How much does it apply to you?	Not at all	A Little	A Fair Amount	Much	Very Much
1. I have difficulty walking	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. I find that food tastes bad	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

**Questionnaire begins here**

How much does it apply to you?	Not at all	A Little	A Fair Amount	Much	Very Much
1. I have difficulty bending or lifting	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. I do not have the energy I used to	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. I have difficulty doing household chores	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. I have difficulty bathing, brushing teeth, or grooming myself	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. I have difficulty planning activities because of the cancer or its treatments	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. I cannot gain weight	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. I find food unappealing	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. I find that cancer or its treatments interfere with my ability to work	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. I frequently have pain	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. I find that my clothes do not fit	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**SOUTHWEST ONCOLOGY GROUP  
PSYCHOSOCIAL QUESTIONNAIRE**

Page 2 of 2

SWOG Patient No.

SWOG Study No. **S**

Protocol Step **1**

Patient's Name \_\_\_\_\_

19. Has it happened in the past that you were surprised by the behavior of people you thought you knew well?  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
never happened always happened
20. Has it happened that people whom you counted on disappointed you?  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
never happened always happened
21. Until now your life has had:  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
no clear goals or purpose at all very clear goals and purpose
22. Do you have the feeling that you're being treated unfairly?  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
very often very seldom or never
23. Do you have the feeling that you are in an unfamiliar situation and don't know what to do?  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
very often very seldom or never
24. Doing the things you do every day is:  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
a source of deep pleasure and satisfaction a source of pain and boredom
25. Do you have very mixed-up feelings and ideas?  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
very often very seldom or never
26. Does it happen that you have feelings inside you would rather not feel?  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
very often very seldom or never
27. Many people, even those with a strong character, sometimes feel like sad sacks (losers) in certain situations  
How often have you felt this way in the past?  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
never very often
28. When something happened, have you generally found that:  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
you overestimated or underestimated its importance you saw things in the right proportion
29. How often do you have the feeling that there's little meaning in the things you do in your daily life?  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
very often very seldom or never
30. How often do you have feelings that you're not sure you can keep under control?  
☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐ 6 ☐ 7  
very often very seldom or never
